

Sample Monster Build

That's a lot of information to parse, so let's walk through the step-by-step process and see how it all comes together. We'll start with a generic mad scientist of respectability 1, with 4 in SCI-ENCE! and 3 in MADNESS!, which means:

- Their parts limit when making a monster is 4.
- They can distribute up to 11 endurance between all body parts (10 + their respectability of 1).
- They can spend up to 7 points on Brains and Brawn, and thus 7 points on abilities.

Let's say our basic blueprint will be an average-sized Bioconstruct. Our esteemed colleague Dr. Regularius Generic doesn't want any given body part to be too fragile, so they decide on only 3 parts, two of them with 4 endurance each and the last with 3 endurance. They assign a Brains score of 2 and a Brawn of 5—the monster won't be too smart, but there'll be no real risk of disobedience (since Brains 2 is less than Dr. Generic's MADNESS! score of 3).

Because it has 3 body parts, the monster can also have up to 3 abilities (1 per part). Dr. Generic knows several ability blocks that came with their original YGORE, plus some shared by their think tank. They want a mobile monster that can clear difficult terrain, that's hard to kill, and that spews noxious vapors at enemies. They decide to make something that's kind of like a flying sand dollar, with a hard outer shell and gas-spouting orifices. The monster's layout looks like this:

- Skeleton
- Gas bladder
- Vents

There are 7 points to spend on customizing abilities between the parts, so Dr. Generic has to be efficient. They decide to take a single point of weakness to bring it up to match the think tank's other 8 point monsters. They decide to break it down this way:

- Core: [Splice of Life core feature]
- Skeleton: [RESIST +1d10 physical]
- Gas bladder: [MOVE hover][DASH +1]
- Vents: [DAMAGE +2d10 toxic/brawn][APPEND corrupted][CLEAVE 2 burst, line]
- Weakness: [RESIST =>1d10 thermal]

Thanks to its tough skeleton, this monster may only roll 2d10+2 when defending with Brains, but rolls a respectable 3d10+5 Brawn when defending against physical stress—at least until its skeleton is broken. It will have a hover speed of 1, levitating on gas jets to hover over difficult terrain. Finally, it will be able to fire puffs of toxic fumes in a cone with a range of 0 (so, just foes in the same zone, but several of them), rolling 4d10+5 for the attack (from its [DAMAGE] and its Brawn, since this isn't a mental attack); anything caught in the blast will suffer toxic stress and gain a stack of the corrupted condition for a turn.

In order to squeeze in that last ability point, Dr. Generic decides it makes sense for a monster full of gas to be especially flammable, so foes roll an extra die when attacking it thermally.

Now Dr. Generic only needs to know what their creation will cost, in time and data. Since it will have 11 total endurance and a total of 7 Brains and Brawn together and is a simple Bioconstruct, this monster will take 36 research (11+7=18, x2=36) to create and cost them 180 data (36x5) to produce in their lair.

That sounds like a perfectly reasonable expenditure to our mad scientist, so at the beginning of their next downtime period, they spend the 160 data and begin a new project to grow the monster. When the project reaches completion, they'll have a brand-new, delightfully ghastly friend able to join their adventures right away!

Whirling Fumigator

AEROFOUL

Five narrow, humanlike eyes encircle this roughly discoid monster, alternating with respiratory vents reminiscent of piglike snouts. Its upper surface is a five-lobed, colorfully splotched shell, while its snouts and its lower surface are covered in lumpy, wrinkled skin.

BIOLOGY:

The Aerofooul's simplicity suggests an early experiment in the career of its indeterminate creator, and its sudden, rapid spread is indicative of a relatively recent one. A fused, compact skeleton constitutes most of its body mass, its bone tissues consisting of a fine silicon-reinforced nanolattice as durable as steel but nearly lighter than air, permitting the monster to levitate freely as its sixteen lungs continually draw air through its single dorsal intake and out through its lateral vents. Feeding on the dense chemicals of Mortasheen's smog cover, the Aerofooul's only digestive by-product is a refined powder of nitrogen oxides, methane and chemo-synthetic bacteria it stores within a secondary ring of more specialized lung sacs. When agitated or startled, it floods these sacs with a salivary secretion, churns the waste powder into a fine froth and exhales it into a heavy, sticky smokescreen. The intense fumes are sickening even to many other specialized smog-eaters, and extensive enough inhalation can be life threatening to less adaptable monsters.

A mature and well-fed specimen may begin to undergo asexual fission, gradually developing into two mirrored individuals over the course of only a few weeks.

BEHAVIOR:

The Aerofooul's minimal soft tissues are hardly worth the hassle for most predators, and it lacks fear altogether, but it is irritated by intrusion into its personal space and quickly angered by unwanted touch. This is unfortunately not a two-way concern, as the highly curious, easily bored Aerofooul enjoys following, watching, nudging, or even landing atop other creatures for extended periods of time.

Though its concentration of methane is highly combustible, an Aerofooul is attracted to open flame, cautiously savoring the flavor of smoke.

Scanalysis Goal: 14
BRAINS: 2
BRAWN: 5

AEROFOUL - AVERAGE BIOCONSTRUCT		Parts (3)	Endurance (11)
Shelleton		Skeleton	4
[RESIST +1d10 physical]			
Smog Skimmer		Gas Bladder	4
[MOVE hover][DASH +1]			
Gasblaster		Vents	3
[DAMAGE +2d10 toxic/brawn][APPEND corrupted][CLEAVE 2 burst, line]			
Weakness: Fire Hazard [RESIST =>1d10 thermal]			
QUIRK: Uninvited Flying Object
